

2026-06-14: measured street water through the evening high tide

Tape points retain their actual observation times; the gray line is bay water, not a street observation.

No rain, wind or surge correction is added to the tape readings. Upstream grate is uneven and shown separately.

Residuals use linear interpolation between 6-minute Sandy Hook readings. They do not isolate wind, rain, gate effects or measurement error. NOAA later-retrieved verified data; not an as-issued forecast test. Full methods and Battery timing check: README.md.
